A Financial Plan for the Future

By Peter Haughton, South Australia

Money is number 1… nothing else compares.

Without a credible business plan which is easy to develop in such a rich country., any attempt will be futile.

1. Our debt is the political parties debt, yes, but we have to show capacity to pay it, get control, then tell them to "fuck off with their $500B debt". Showing ability to pay off debt is easy.

2. Gold mines and Currency
We have a list of all the gold reserves in the NT where there are over 500 viable mining prospects that need due-diligence to confirm. However, they add up to around $200B in value. The same will apply for Queensland and WA, which will be much larger. If you open up Google Earth and zoom in on Kalgoorlie, WA, you can see a huge gold mine there that is so deep we cannot see the bottom.

How much gold have we lost from that mine alone, and where is the MONEY!

We are investigating gold reserves in all other states now, and once we get all that we are under way. This is just the Gold reserves, so once we start venturing into Silver, Lithium and others, it will blow right up to extra-large numbers we can use to back up the currency. Let's stick with Gold for starters, then Diesel fuel production, as its going to move and people for just cents a litre, and people want that the most.

Let's say $500B total gold reserves for a start, but we have much more. When an asset is inground surveyed = drill logged in say 50 Meter intersections this displays total volumes of net extraction for certain. The inground assets are valued at 10% bankable = $50B for lending under the current Federal Reserve rate, so we then gold-back the money at 10% fractional reserve system but not in it because our currency will be Gold backed so it will be worth much more than fiat money. That gives us back $500B in Cash, which is exponential. In reality, we will have much, much more to show how we can annulate the $500B debt.

We then fund 300 gold mines and others at say $50M each = $40B = 5,000 jobs @ 10% from production with time limits. That production coming out of the ground from interest goes into the Commonwealth gold vault and kept here in Australia to act as the fractional reserve lent out into the market again. Once there is enough cash and things are firing we will lift the gold ratio up to 20% increasing, making our system of gold backed currency exponentially valuable. Every gold bar will have 2 serial numbers; say bar 1 will have 1-100 = 100x $100 notes in series with that series of numbers.

3. Fuel security and Australia's own production.
The political parties have destroyed our fuel production systems and now we

import all fuel from overseas. This is ridiculous. Australia has massive shale oil fuel reserves in the ground that will fuel us for at least two more centuries; more than enough time to come up with other fuel systems.
Now we still have $460B left before we mine, so we spend $50B over 1-2 years securing are Diesel fuel production and creating 10,000 jobs into the bargain.

Retaining some $20-$40B in outgoing international fuel remunerations.

We need about $200 B profit to fuel an economic each year and pay off the debt.

$50B fuel profit will be kept here to use as needed to benefit the People of the Commonwealth of Australia.

$10-20B will be gold profits, and the rest will come from the other industries bouncing off the mining and fuel profits and wages spinning off from the system easily paying a corporate flat tax of 12% -- although if we really want to create a booming economy we recommend a bank transaction flat tax of just 0.02%..

4. Medical research

$100B to be spent on a medical Research fund to produce the best alternative and modern medicine in the world, then sell the patents to other countries at a one-time exit fee 50% of pharmaceutical costs for 5 years. = 10-20,000 jobs profiting billions a year exponential. Cystic fibrosis would take about 2 years to fix if we had the money as we have already looked at it with a professor 5 years ago.

5. Bush tucker and freeing the indigenous.

The Bush Tucker industry is screaming to be developed. The Kakadu plum has 10x the vitamin C than any other fruit or vegetable in the world. Griffith university has done many significant studies on its healing powers for cancer. There are about 20 other highly sought species than can produce mega money in the Nutraceuticals industries.

The industry can produce $10B in profit annually after 4-6 years $20B in = 5,000 jobs, plus we could get the indigenous off the dole and making their own money, dictated to by no one, which would bring back their pride, fulfilment and self-esteem.

Plus, let’s not forget the massive hemp industry for nutraceuticals and major building products.

We can supply all of the forensics for all of the above.

At this stage we will still have $280B in the nation’s bank to protect all the pensions for 3 years without profit.

6. Administration and Protection of Constitutional and common law rights Royal Warrant x12.

Same number as disciples, we will have no power unless all agree to arrest by signature of warrant holders.

Her Majesty's Governor-General remains, unless we the People of the Commonwealth indict him for any crimes he may commit and then sack him. And so on. People like Wayne Glew, Brian Shaw, Mike Holt, Dick Yardley, David Walter, Peter Haughton, Lee Tonkin Jones and others could be elected by the people to sit as the 12 needed to call a referendum until we elect a proper People's Parliament. All political parties banned from ever fielding candidates to sit in our parliament ever again.

7. The New Government will be picked as per the 1901 Commonwealth constitution but the 12 will hold interim government until the dust settles and 12x Warrants stay forever to be passed on.

8. A demonstration of financial numbers to immediately support our disabled, elderly, and veterans at a comfortable level equal to at least the lowest wage rate… but preferably higher.

9. An unemployment scheme that plants trees (South), digs canals and builds dams to manage our water resources, and teams to exterminate ferrel species, such as cane toads, foxes, flying foxes, cats, dogs, etc with a budget of $5B. We could generate income from these eradications by creating industries to use the pelts and skins for furniture and clothing, as well as manufacturing pet food and fertilizer from the bodies of animals killed.

10. $1B invested in helping train the homeless in skills that will enable them to work, supply low-cost home loans to get them off the streets and give them dignity, and supply mental and physical health support for those that need it.
